Flow transmitter

GENERAL CHARACTERISTICS

Built entirely of PVDF, its use is particularly indicated for the chemical and medical electronics industries. The sensor consists of a turbine rotor that enters in rotation with the passage of fluid. The fluid is forced into a helical motion by a special conveyor. The speed of rotation is proportional to the flow. The measurement is detected by an IR sensor external to the flow chamber. The particular shape of the turbine and of the flow conveyor determines a high measurement precision and a repeatability of 0.1%.

- Construction in PVDF.
- Hermetic separation between flow chamber and IR sensor.
- High accuracy and repeatability of measurement.
- Mechanics with interchangeable cartridge (KTI) on request.
